Appendix – List of Parks Managed by the Chicago Park District	25

Introduction

Parks are key resources in cities—a source of pride for city citizens, an attraction for visitors and an enhancement to the quality of life for residents.

The Chicago Park District is one of the largest municipal park managers in the nation and controls over 600 assets including parks, beaches and harbors. To external observers, it might be most known thanks to some of its landmark locations which are among the most unique in the country, but the impact of its activities reaches neighborhoods throughout Chicago, serving over 40 million people annually.

While the benefits of parks are mostly intuitive for residents and visitors alike, is there a quantitative way to measure their value? Studies are few, often limited in scope, and data is mostly anecdotal. Therefore, at the end of 2013, the Chicago Park District embarked in an initiative to objectively assess the impact of its assets on Chicago's economy.

For this effort, The Chicago Park District partnered with Civic Consulting Alliance, Global Economics Group, and Roland Berger Strategy Consultants. The 585 parks that the Chicago Park District owns were included in the analysis, making it one of the most comprehensive studies ever undertaken of a park system's economic benefit.

Summary

At the end of 2013, the Chicago Park District partnered with Civic Consulting Alliance, Global Economics Group, and Roland Berger Strategy Consultants to determine the impact of Chicago Park District-owned assets on the City of Chicago's economy. Having hypothesized that parks do have a positive impact, the project aimed to help the Chicago Park District test this theory and quantify the effect, if any.

To determine the parks' impact on the local economy, two main metrics were selected:

Relative impact of parks on property value. This represents the best indicator of value regarding the benefits for residents associated with a parks' presence, and is a proxy for other qualitative and subjective factors (e.g., quality of life). Higher property values of parcels in close proximity to parks can be regarded as the net present value of the benefit associated with living in such a location.

Revenues generated by parks' special assets. These metrics capture the additional benefit of Chicago Park District assets to Chicago. Their economic significance was determined by aggregating various metrics, including event attendance, museum visits, and visitor spending. Assumptions were also made on the contribution of Chicago parks to the city's ability to attract tourists.

The analysis of data on almost 600 parks shows that – with a conservative approach – they add at least \$900 million (1.5% of total) to the value of residential properties located within 0.15 miles of a park (roughly one and a half blocks). In other words, residential properties within 2 blocks of a park – 43% of all residential properties in Chicago – experience on average 1.5 percent higher property values directly attributable to their proximity to a park.

The analyses find that the positive impact on property value holds true across all park categories, although to different degrees.

The study establishes that individual “magnet parks¹” like Lincoln Park have the largest property value impact on a per park basis; however, as a group, “miniparks²” appear to have the largest relative and absolute positive impact on property values.

The economic significance of events, special assets and tourism is considerable for Chicago, and is estimated between \$1.2 and \$1.4 billion each year. The results capture the benefits as a snapshot in time, based on the most recent data available.

Overall, the assessment indicates that parks generate significant benefits for Chicago’s residents and economy. Collectively, they represent a powerful portfolio of assets: each park category plays a distinctive role in providing different kinds of value for Chicago’s residents:

- **Revenue generation:** The revenue generated by assets and events hosted in parks are significant contributors not only to the Park District’s economic viability, but to the local economy through tourism
- **Community engagement:** more than 540,000 patrons participated in Parks’ programming activities in 2012
- **Tangible value** for residents, whose property value is increased by their proximity to parks

¹ A Magnet Park is defined as “a large park in excess of 50 acres that contains a combination of indoor and outdoor facilities which regularly attracts large numbers of persons from the entire metropolitan area and beyond”. This category includes the following Chicago parks: Burnham, Grant, Humboldt, Jackson, Lincoln, Northerly Island, Union and Washington.

² A Minipark is defined as a park less than ½ acre in size with playground apparatus. The park may or may not contain other indoor or outdoor recreational facilities”. Approximately 140 Chicago parks are included in this category.

Definitions of Park Categories

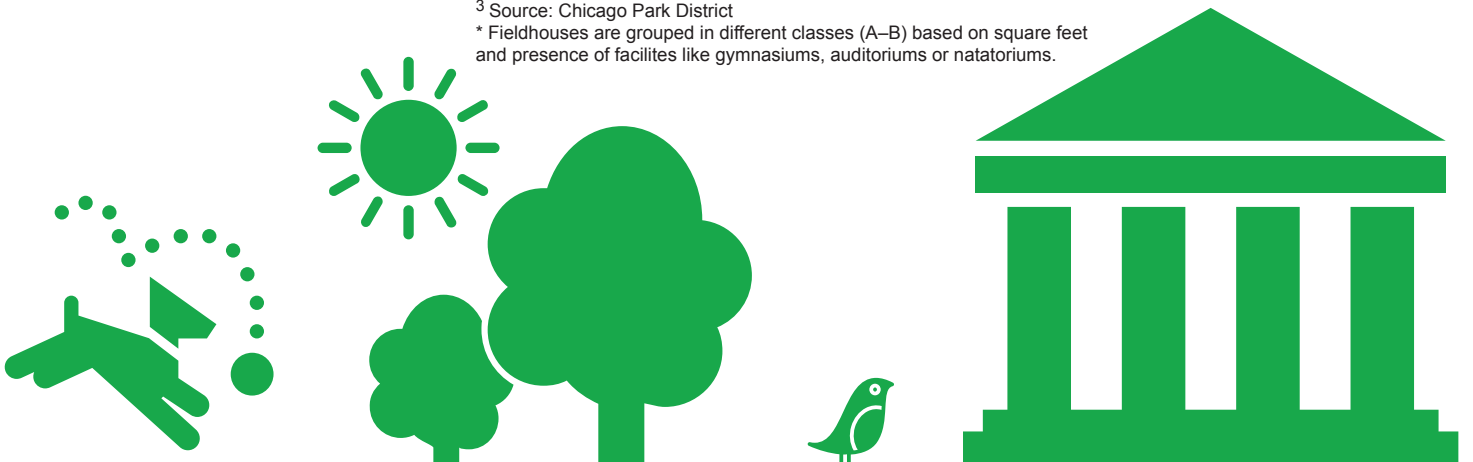

The Chicago Park District manages almost 600 assets across Chicago, which are extremely diverse in size and characteristics. In this study, the different categories of assets are defined as follows³.

- **Magnet park:** a large park in excess of 50 acres that contains a combination of indoor and outdoor facilities which regularly attracts large numbers of people from the entire metropolitan area and beyond.
- **Citywide park:** a large park of at least 50 acres that contains a combination of indoor and outdoor facilities which attract patrons from the entire city, but which primarily serve the population living within one mile. Citywide parks have a Class* A or Class B fieldhouse (a fieldhouse is a recreation facility) and at least one magnet facility, such as a museum, cultural center, conservatory, marina major lakefront beach, stadium, sports center, or golf course. Citywide parks also contain a variety of passive and active recreational areas.
- **Regional park:** a park that is generally from 15 to 75 acres that has a Class A or Class B fieldhouse. Regional parks also contain a variety of passive and active outdoor recreational areas.
- **Community park:** a park that is generally from 5 to 25 acres with a variety of indoor and outdoor recreational facilities. Community parks include those with more than 15 acres that have a Class C or Class D fieldhouse and parks with less than five acres that do have a Class A fieldhouse, Class B fieldhouse, or a magnet facility.

³ Source: Chicago Park District

* Fieldhouses are grouped in different classes (A–B) based on square feet and presence of facilities like gymnasiums, auditoriums or natatoriums.

- **Neighborhood park:** a park that is generally ½ acre to 5 acres with playground apparatus. The park may contain other indoor or outdoor recreational facilities. Indoor facilities shall not exceed the size of a Class C or Class D fieldhouse. Exceptions are parks with more acreage but that have no indoor facilities.
- **Minipark:** a park less than ½ acre in size with playground apparatus. The park may or may not contain other indoor or outdoor recreational facilities. Indoor facilities do not exceed the size of a Class D fieldhouse.
- **Passive park:** a landscaped park without indoor or outdoor facilities for active recreation. Such a park may be used informally for active recreation, but there are no designated playing fields. Such a park may have fixtures and accessory uses, such as parking, benches, paths, walkways and drinking fountains.
- **Linear park:** narrow parks; either former right of way or parallel with railroad right of ways. Can be passive or active and may have a multi-use trail or riverwalk.
- **Nature preserve park:** land devoted to the establishment and preservation of natural areas that may have facilities for nature education.
- **Triangle park:** small passive area surrounded on three side by right of way.
- **Unimproved park:** park land acquired for future park development.

The Power of Parks

To provide an assessment of the impact of Chicago parks on the local economy, the project team needed to identify appropriate metrics. Studies conducted in the past have been either limited in scope or based on anecdotal data. For this effort the project team looked for indicators that could provide a comprehensive but at the same time granular analysis, and reflect the Parks' benefits for residents and visitors.

The team selected property value as an indicator of the value for residents. It can be regarded as a proxy for qualitative benefits like such as quality of life or environmental benefits; it also has the advantage of being measurable with a comprehensive set of comparable data throughout the City.

To capture additional benefits delivered to Chicago's economy, the team chose to analyze and interpret information about tourism and revenue generated by assets and events hosted in the Chicago Park District assets.

The two indicators are not additive to each other for two reasons: first, because available data supporting individual analyses was not for the same period⁴: second, and more importantly, the former can be considered as the net present value of the benefits associated to living in proximity of a park (the incremental price residents are willing to pay for a property located in the vicinity of a park) and the latter as the revenue generated in one year by the assets and events managed by the Chicago Park District.

The analyses performed by the team, and the aggregation of data from multiple sources, clearly indicate that the economic significance of Parks on Chicago's economy is not only positive, but significant.

⁴ Available Assessor's data for property value was for cy 2012; revenue generated by Parks' events was mostly reflective of 2013 cy

Property Values

A park's economic impact on surrounding property values is an indicator of the value created by that park. Indeed, an estimate of the park's economic impact on property value incorporates qualitative and subjective factors such as quality of life, health or environmental benefits that are otherwise difficult to measure. The higher value of properties located in parks' proximity can be considered as the net present value of the benefit associated with living in that location.

The team conducted an analysis to measure the impact on property value of Chicago Park District assets based on the application of hedonic pricing methods and on a conservative approach that is consistent with economic theory. On average, the results from the model are statistically significant and positive, showing that the closer a property is to a park, the higher its value, after controlling for housing and environmental attributes.

The necessary data was acquired from The Cook County Assessor's Office which provided a database of assessed property values and other identifying information for all Chicago properties for the year 2012. The data contains 827,326 observations, each representing one housing unit, and includes geo-coordinates of the property, land square footage, and assessed value. The data also included (when available) detailed housing characteristics for each unit: number of rooms, square footage of the building, and garage type, among others. In addition, the Chicago Park District provided a database of the parks it manages, complete with details for each individual park, including amenities (outdoor pool, playground, basketball court, etc.), acreage, and park class (e.g., community park, mini-park, magnet park, etc.). All geospatial boundary data was acquired from the City of Chicago GIS Portal.⁵

The Assessor's data was cleaned by removing extreme outliers, and computed additional variables for each property. In particular the study determined the distance between each property and:

- **the perimeter of each park**
- **the nearest "L" stop**⁶
- **the city center (Central Business District).**

⁵ http://www.cityofchicago.org/city/en/depts/doit/supp_info/gis_data.html

⁶ The "L" (short for "elevated") is the rapid transport system serving the City of Chicago and some of its surrounding suburbs

The next step included the definition of “park markets” using Google Earth to determine which properties to analyze around a specific park.⁷ Some parks are located in close proximity to - for instance - railroad tracks, industrial facilities or vacant land, which could have a negative impact on the value of a property. Blindly including all properties within a given radius of a park without taking into account confounding attributes could lead to incorrect and misleading modelling and thus results.

The park market creation process for each park was executed in successive steps:

1. Visually analyze the environment around each park and note any attributes in the area that could be potentially confounding;
2. Using the polygon tool in Google Earth, draw the park market so as to include only similarly-situated properties (meaning, define the market so that all properties inside the market polygon are more-or-less equally affected by the external confounding factor);
3. Exporting the resulting polygon into Global Economics’ GIS programming software and, for each park market, applying a park market classification variable to the properties in the assessor data that are located inside the park market.

The resulting park markets were oftentimes narrowly defined and thus a subset of residences that extract value from the park (for example, due to confounding attributes, the park market could include only the properties that exist inside a 100’ x 400’ rectangular strip of land). Therefore, in order to compute the total market effect, which is described below, we also created a broader park market for each park. The broader markets were created using the same mechanical steps as the narrow park market, but were drawn to encompass all properties that have reasonable access to the park, regardless confounding attributes.⁸

⁷ Note that we were unable to draw park markets for 26/583 parks because either there were no residential properties within .20 miles of the park or the park was confounded by other parks.

⁸ For example, reasonable access to the park would not include residences where there was a major industrial complex, railroad, interstate, or other attribute that would severely restrict ability to walk to the park.

Within each park market and for all residential properties that are within 0.2 miles of the park, we ran a hedonic pricing regression on property market value.⁹ The concept underlying the hedonic pricing model is that the price of a house is determined not only by the characteristics of the house (e.g., number of rooms, central air, attached garage), but also by ambient environmental attributes such as the property's nearness to a park. Our model controls for housing characteristics,¹⁰ the distance of each property from the city center, the distance of each property from the nearest "L" stop, and the distance of each property to the nearest park, as specified with the following categorical variables:

- **0.00 to 0.05 miles to park boundary;**
- **0.05 to 0.10 miles to park boundary;**
- **0.10 to 0.15 miles to park boundary;**
- **0.15 to 0.20 miles to park boundary (reference group)**

Furthermore, because we include only properties that exist within the defined park markets and we run one regression for each park, our model indirectly controls for ambient neighborhood characteristics such as neighborhood, school district, crime and socioeconomic attributes.

In addition, we ran a pooled regression that models the interaction of housing characteristics and park indicator variables and found that, on average, the distance categories are statistically significant and positive, showing that the closer a property is to a park, the higher its value, after controlling for housing and environmental attributes.

Lastly, we computed a measure of economic impact on property value for each park. We applied the coefficients on the distance to park categorical variables from our individual park-level regression to all properties within the broader park market to get total value on both a dollar and percentage basis. This approach is conservative because we computed the impact for only the residential properties that are within 0.15 mile of the park (note that properties 0.15-0.20 miles from the park

⁹ Note that the market value is scaled up from the assessed value using City of Chicago conventions. For more information see: "The Cook County Property Assessment Process: A Primer on Assessment Classification, Equalization and Property Tax Exemptions," The Civic Federation, April 5, 2010. Available at: http://www.civicfed.org/sites/default/files/100405_CookCountyAssessmentPrimer.pdf.

¹⁰ Housing characteristics controlled for include: square footage of the building, square footage of the land, distance to the city center, age, number of full baths, number of rooms, number of half baths, whether or not the residential unit has a garage, whether or not it has A/C, and whether it is used as a single- or multi-family home.

form the reference group in our regression, and are not included in the computation of total impact), even though the property value created by the park could very well extend beyond that range. Indeed, because only 45% of residential properties in the assessor database are within 0.15 miles of a park, our analysis only captures the relative impact of being closer to a park, not the total impact of park district assets, which likely extend in some extent to all properties.

The results of the analysis described above were summarized by park type, region, and in other ways.

Overall, the impact of Chicago Park District’s assets on property values is positive and significant. In particular, we have found that Park District assets add at least \$909 million (or 1.5%) in property value to residential properties that are within 0.15 miles (~800 feet) of parks.

As shown in Exhibit #1, the positive impact is consistent across park types and regions. As a park class, mini-parks have the largest overall impact on property values – on both a relative and an absolute basis. On an individual park-level basis, magnet parks have the largest economic impact.

Exhibit #1 Parks’ impact on property value.

Park class	# of parks	Total impact per park class (\$m)	Acres	Impact as a % of market value	Impact per acre	Impact per park (\$k)	Impact per property
Magnet park	7	\$134	3,275	1.6%	\$40,784	\$19,083	\$2,738
Mini-park	141	\$335	34	2.8%	\$9,808,236	\$2,375	\$6,602
Citywide park	9	\$9	1,351	0.8%	\$6,444	\$967	\$1,127
Community park	117	\$68	948	0.6%	\$71,299	\$578	\$1,364
Neighborhood park	157	\$146	350	0.9%	\$418,838	\$932	\$1,741
Regional park	46	\$43	1,210	0.9%	\$35,369	\$930	\$1,581
Passive park	56	\$159	113	2.4%	\$1,409,855	\$2,843	\$4,137
Nature preserve park	3	\$3	215	2.0%	\$12,107	\$869	\$3,497
Unimproved park	21	\$13	90	0.8%	\$147,099	\$629	\$1,580
Total	557	\$909	7,587	1.5%	\$119,827	\$1,632	\$2,881

We found a positive impact on property value across all the regions, but a relatively higher impact in the North region. Lower results for Central and South region are not surprising given the difference in density and other socioeconomic factors. The positive impact is observed for properties near every one of the defined park categories, though differences exist among categories. Miniparks have the largest relative impact, the largest impact per acre, and the largest impact per property within 0.15 miles. Citywide, regional, community, and neighborhood parks have less positive property value impact, but focus on providing wide variety of programming and amenities to the larger community. Magnet parks have the largest impact per park (largely driven by Lincoln Park).

As mentioned earlier in this section, our model controls for housing characteristics, the distance of each property from the city center, the distance of each property from the nearest “L” stop, and the distance of each property to the nearest park, as specified with the following categorical variables;

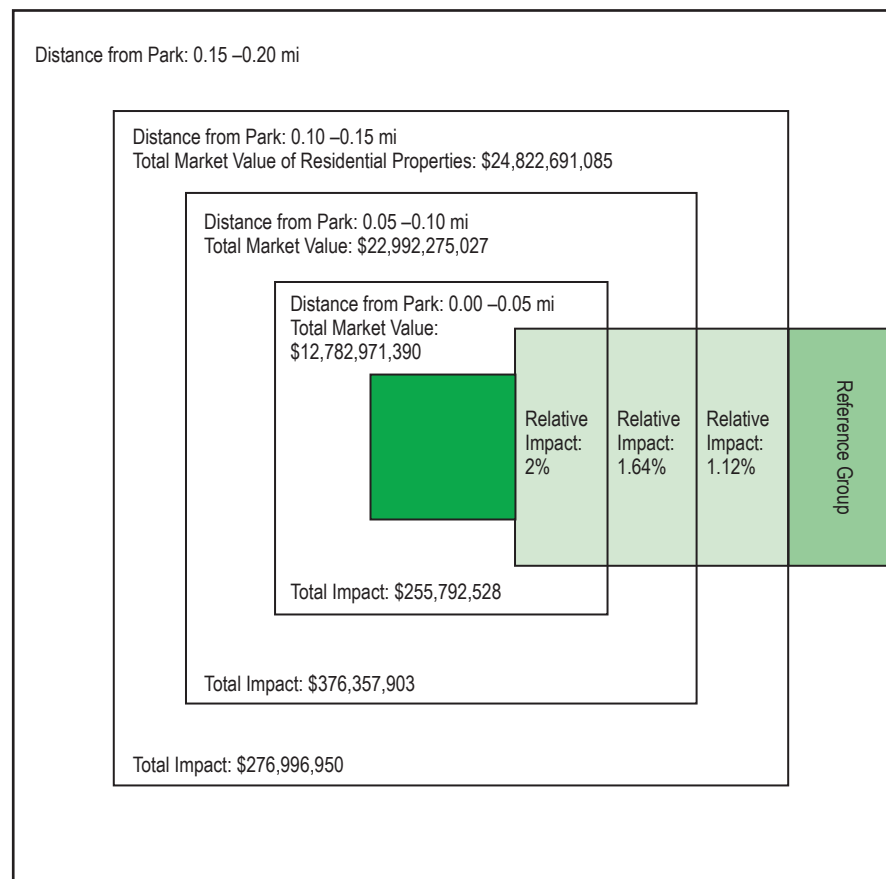

- **0.00 to 0.05 miles to park boundary;**
- **0.05 to 0.10 miles to park boundary;**
- **0.10 to 0.15 miles to park boundary;**
- **0.15 to 0.20 miles to park boundary (reference group)**

Exhibit #2 shows overall results by distance group. The closer a property is to a park, the higher the economic impact the park has on the property value, relative to the reference group.

Exhibit #2 Impact on property value.

In addition, we controlled for other factors that could potentially contribute to a parks' positive impact on property value, such as the distance from downtown and crime rate. The distance from downtown clearly influences the relative impact of parks. While it explains a small amount of the variation across parks, distance to city center (i.e. the loop) is likely a proxy for population density. This is consistent with economic theory that would predict parks would have the most impact where green space is more scarce.

There is evidence that a higher crime rate around a park tends to lower the beneficial impact, but it is not statistically significant and is therefore inconclusive.

Events, Special Assets and Tourism

The assets managed by the Chicago Park District include some of the most popular public spaces in the city, attracting millions of locals and visitors alike every year. Parks are home to some of the largest events in the city, such as Loolapalooza, Taste of Chicago, and the Air and Water Show. Soldier Field, housed in Burnham Park, is home to the Chicago Bears NFL team as well as many concerts, sporting events, and activities throughout the year. Parks are also home to Chicago's major museums, and ten harbors are located in parks.

These assets and events have a significant impact on the local economy both in terms of direct and indirect revenues. Direct revenues include direct spending generated at events (e.g., ticket sales, concessions, merchandise) as well as revenue generated by museums and harbors. Indirect revenue includes tourism spending outside of events by out-of-town attendees (e.g., lodging, dining, transportation) and incremental tourism driven by parks. Unlike the property value analysis, in this case a comprehensive and homogeneous set of data was not available. Rather, the team collected, analyzed and developed assumptions on information from multiple sources and with different levels of granularity. The assessment was focused on four areas:

- 1. Major park events**
- 2. Museum revenues**
- 3. Harbor revenues**
- 4. Incremental tourism**

According to economic theory, the true impact of an event or an asset should be measured as the “net” addition that each asset or event brings to the local economy, (i.e., money that is spent in the city which otherwise would not have flowed in the local economy). For example, the money spent by a resident to attend a concert in a Chicago park cannot be counted as economic impact, since it should conservatively be assumed that if that event did not exist, the corresponding disposable income would have been spent on another offering (entertainment, services, etc.) provided within the city. On the other hand, the money spent in Chicago by a visitor associated with that event should be considered as a positive impact to the local economy. This project explored both revenues generated by locals and tourists in order to understand the scale of activity parks drive in both areas. Therefore, in aggregate, the data should more correctly be regarded as measures of economic significance, as opposed to economic impact.

Major Park Events

This analysis evaluated 2013 event data from eight magnet parks, which account for all large events on Chicago Park District's property. Data was requested for thirty events and received data for twenty one. Where data was unavailable, assumptions were made leveraging data for similar events and Chicago Park District expertise.

Exhibit # 3 Chicago Parks' major events.

Music Festivals and Concerts

- Lollapalooza*
- Blues Festival*
- Chicago Jazz Festival*
- Northerly Island*
- North Coast Music Festival
- The Chosen Few House Music Picnic
- Riot Fest
- Pitchfork
- Chicago Summer Dance

Sports

- Rock-N-Roll Half Marathon*
- Hot Chocolate Run*
- 13.1 Marathon*
- Chicago Half Marathon Soldier Field (Bears)*
- Chase Corporate Challenge*
- Koman Mother's Day Walk*
- Ron Santo Walk to Cure Diabetes*
- Chicago Triathlon*
- Turkey Day Run*
- Shamrock Shuffle
- Chicago Marathon

Other Cultural Festivals

- Taste of Chicago*
- Cultivate*
- Puerto Rican Festival*
- African Festival of the Arts
- UniverSoul Circus

Entertainment

- Chicago Air and Water Show*
- Flugtag*
- Soldier Field (non-Bears)*

* Indicates events for which actual data was received from event organizer.

For all events, direct revenues include spending at the events (e.g., tickets, concessions, merchandise). This metric was estimated using four formulas, pending what data was available for the individual events:

1. # attendees	X	(average ticket price + average merchandise & concession spend)
2. (# attendees X average ticket price)	+	(total merchandise & concession spend)
3. Total ticket spend	+	(# attendees x average merchandise & concession spend)
4. Total ticket spend	+	Total merchandise spend

Indirect revenues were measured by estimating the incremental tourism revenues generated by non-locals attending the events. Two formulas were used for this estimate, pending what data was available for individual events.

1. (# attendees X % tourists)	X	(spend per visitor per day X length of stay attributable to event)
2. Total tourism spend outside event		

Depending on the nature of the event, the number of attributable tourism days varies:

- Single day event → 1 day of visitor spending outside of event
- Multi-day event → 1 day of visitor spending for each day visitor attends event
- Marathon and Triathlon → 2 days of visitor spending outside event

In this analysis, only event participant impact is included (guests in participant's travel group and athletic event spectators are not included, as such data was limited or non-existent). Therefore, the estimated indirect revenue generated in this case should be regarded as conservative.

Museums

Some of the most significant Chicago museums are on Park District property: Adler Planetarium, Chicago History Museum, DuSable Museum, Field Museum, Lincoln Park Zoo, Museum of Contemporary Art, Museum of Science and Industry, National Museum of Mexican Art, National Museum of Puerto Rican Arts and Culture, Notebaert Nature Museum, Shedd Aquarium and The Art Institute of Chicago. Collectively, they represent a major attraction for residents and visitors.

For these museums, we accounted for several types of revenue generation: membership dues, total program service revenue (i.e., what museums earn through the programs they host), and gross rental revenue. The analysis excluded donations and investment gains/losses.

We assessed museums' revenue through a review of their financial statements. At the time of analysis, 2013 data was unavailable, so 2012 revenues were grown at the inflation rate to provide a rough idea for 2013 impact. The National Museum of Puerto Rican Arts and Culture was excluded, as data was not available at time of analysis.

Harbors

The parks managed by the Chicago Park District are also home to several harbors. We accounted for the impact generated by these assets by analyzing 2009-2012 direct revenue streams from harbors, as provided by harbor management.

The analysis used gross revenue to most fully capture the significance of harbors to Chicago's economy. Few tourists leave boats, therefore tourism impact beyond gross harbor revenue is estimated to be minimal.

As 2013 data was unavailable at time of analysis, it was assumed to be similar to 2012 (rounds to same value when adjusted to 2013 for inflation).

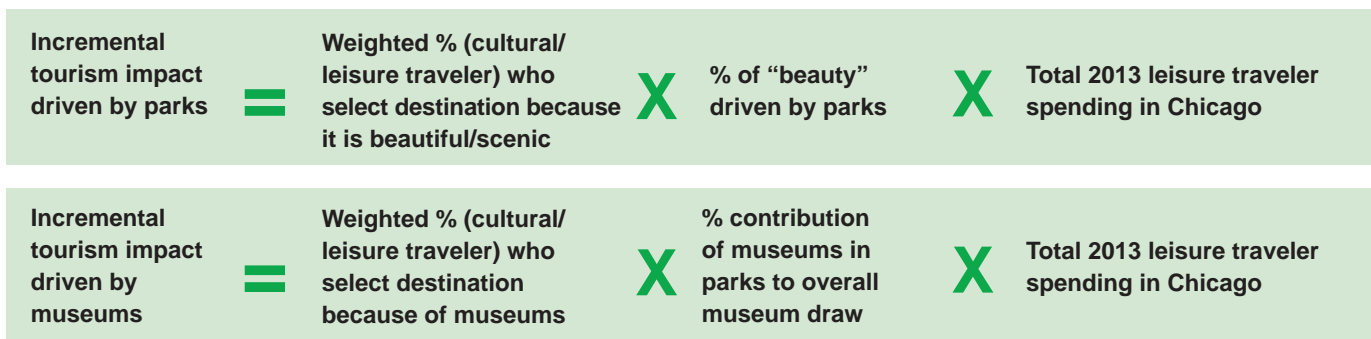

Incremental Tourism

Studies show that the number one factor in destination selection for leisure travelers¹¹ is the degree to which a location is “beautiful or scenic”, with a significant proportion of cultural travelers citing this as an important consideration when selecting a destination¹².

Parks play a major role in making Chicago more beautiful and scenic, and therefore help influence visitors in selecting Chicago as a destination. Thus, parks can be credited with generating a portion of tourists’ visits to Chicago. Similarly, museums draw tourists to Chicago, with many cultural travelers¹³ rating museums as “important” to choosing their destination¹⁴.

The impact of these visits was estimated using the following methodology:

The first piece of each equation (weighted percent of cultural/leisure travelers who select a destination because it is beautiful/scenic or because of museums) was estimated using data from Choose Chicago on what percent of leisure travelers are cultural travelers versus non cultural travelers, and among these respective groups, the extent to which each factor influences trip decisions. The latter was only available for cultural travelers; it was assumed that non cultural travelers are influenced by these factors at half the rate of cultural travelers.

The most subjective pieces of these equations are the percent of “beauty” driven by parks, and the percent contribution of museums in parks to the overall museum draw. As such, a range of values were considered.

Assuming parks account for 5%-25% of Chicago’s “beauty”, they drove \$30 –150M in incremental tourism impact in 2013. Assuming museums on Park District property contribute 50%-75% to Chicago’s “museum draw,” they generated \$190 – 270M in incremental tourism impact in 2013.

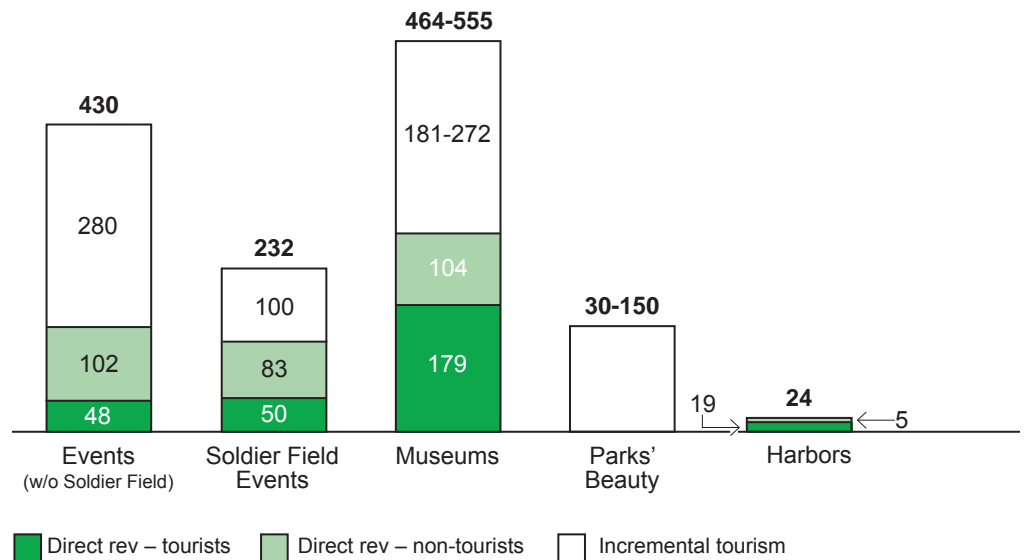

¹¹ “Visitors” or “travelers” are defined as persons traveling 50 miles or more and staying one or more nights away from home.
¹² Source: Choose Chicago Cultural Traveler Study, July 2013
¹³ “Cultural travelers” are defined as travelers for whom arts and culture are typically of some importance to their destination selection process
¹⁴ Source: Choose Chicago Cultural Traveler Study, July 2013

Exhibit #4 summarizes the estimated contribution of Chicago Park District's assets and events to the local economy.

Exhibit #4 Economic significance of events and special assets—2013.

Total impact=\$1.2b – \$1.4b
 Direct revenues = \$589m
 Incremental tourism = \$591 – \$802m

Combined, major events, special assets and tourism drive a positive economic significance of between \$1.2 and \$1.4 billion for the City each year¹⁵.

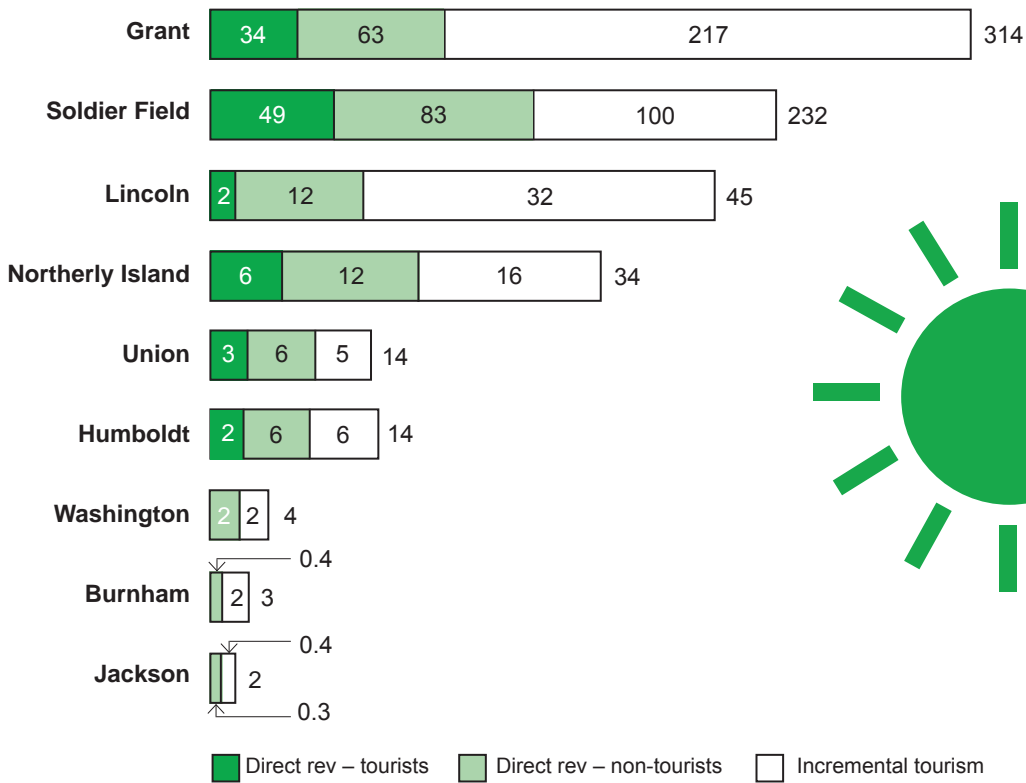

Events and museums are the largest contributors to both direct revenue and incremental tourism. Music festivals / concerts and sports are the event types with the largest absolute impact.

As illustrated in Exhibit # 5, Grant Park and Soldier Field hold the highest profile events and generated over 80% of the magnet parks' event revenues in 2013.

¹⁵ Relative to 2013, the last year for which data was available

Exhibit #5 Magnet park event economic significance (\$m, 2013).

Led by events and museums, the Chicago Park District’s diverse assets all contribute to economic activity.

Clearly, magnet parks represent the largest contributor in terms of tourism and direct revenues, mostly generated by the large events they host.

Assets like Grant Park and Soldier Field are vital for the Park district: combined, they account for 80 percent of the event impact.

- Grant Park generates ~\$3 M in gross economic impact every year, thanks to events like Lollapalooza (one of the largest events) as well as other music and cultural festivals;
- Soldier Field alone generates ~\$230 M in gross economic impact for the city per year, and hosts the highest-impact series of events – the Bears games.

Overall, music festivals and sports are the largest category of events, generating 60 percent of the magnet park event revenue in 2013.

- Music festivals also drive the greatest incremental tourism.
- Sporting events, including those at Soldier Field, drive the most direct revenue, and have a significant impact on tourism.
- Entertainment and cultural festivals do not drive as much direct revenue, but they do drive significant value for the city through their tourism impact, accounting for ~50 percent of all event incremental tourist dollars for events held in parks.

The Value of Parks

The analyses included in this study confirm that parks generate significant tangible value for Chicago residents and for its economy, and in more than one way:

- **Tangible value** for residents whose property value is increased by their proximity to a park.
- **Revenue generation** where parks are significant contributors to tourism attraction, and therefore to the local economy. The revenue generated by assets and events hosted in parks' premises are at the same time significant contributors to the Chicago Park District's economic viability.
- In addition, parks play a fundamental role in community engagement: in 2012, more than 540,000 patrons participated in Chicago Park District programming activities.

The granular analysis of the available data (property value, direct and indirect revenues, mapping of activities / programming executed in the individual parks) provides clarity on how each park category contributes differently in delivering value to Chicago's residents, to Chicago's economy and to the fulfilment of Chicago Park District's strategic objectives (see Exhibit #6).

Ultimately parks are the heart of the mission of the Chicago Park District. The District's core values are implemented in parks every day; namely children first, best deal in town, built to last and extra effort. And while an individual park may not make a significant impact on tourism, all parks are anchors of our communities across the city.

Exhibit #6 – park categories’ role.

Park type	Count	Property value impact [USD m]	Special assets & tourism [USD m]	Non-tax revenues [USD m]	Enrollment ¹⁾ [# people]	Average property value impact [%]	
Magnet	7	134	1,173-1,384	69	30,731	1.6%	Special Attractions 
Mini	141	335	–	0	492	2.8%	Mini-Parks 
Neighborhood	161	146	20	1	74,084	0.9%	Amenities Parks 
Community	117	68	–	7	215,217	0.6%	
Regional	46	43	–	5	164,938	0.9%	
Citywide	9	9	10	3	41,227	0.8%	Open Space Parks 
Passive	56	159	–	0	13,548	2.4%	
Unimproved	21	13	–	–	–	0.8%	
Nature preserve	3	2.6	–	–	–	2.0%	
Total	557	909	1,180-1,391	86	540,237	1.5%	

¹ Program & Event enrollment

The comprehensive picture is therefore one of a portfolio of assets that as a whole is a source of significant value for Chicago's residents and its economy. The inventory of Chicago Park District's assets can be regarded as a portfolio in which four separate clusters can be identified:

Special Attractions

Magnet parks – 8 parks are responsible for a large portion of the non-tax revenues of the Chicago Park District and for the majority of the economic benefits generated by events and incremental tourism.

Mini-Parks

Mini-parks fulfill highly-localized resident demand for open space. In spite of their small individual size, with their presence throughout the city, they touch the highest number of residents and generate - as a category - the highest impact on property value.

Amenities Parks

Citywide, regional, community, and neighborhood parks have less positive property value impact, but focus on providing a wide variety of programming and amenities to the larger community. As a whole they therefore play the most important role for community engagement.

Open Space Parks

Passive, unimproved and nature preserves still contribute positive and tangible benefits to residents in terms of increased property values, even though they do not receive active programming from the Chicago Park District.

The analysis performed is based on a detailed mapping of all Chicago Park District's assets, their infrastructure, programming activities, and the direct and indirect revenue they generate. For each park, the project team mapped the value of adjacent properties and a number of additional factors (proximity to public transportation, etc.).

All this information is now consolidated in one tool, in the form of an Excel-based file, that allows analysis of each individual park or any grouping by category, region, etc., that is regarded as useful.

This analytical tool can aid the Chicago Park District in its ongoing analysis of the performance of each park and to leverage best practices in delivering benefits to Chicago's residents and to Chicago's economy.

Acknowledgements

The project team wishes to acknowledge and recognize the members of the Advisory Board for their input and guidance during the execution of the assessment.¹⁶

- **Meghan Harte** – Deputy Chief of Staff, Office of the Mayor
- **Beth Swanson** – Deputy Chief of Staff, Office of the Mayor
- **Michelle Boone** – Commissioner, DCASE
- **David Kennedy** – Director of Special Events, DCASE
- **Paul Gustafson** – CEO, BCKSTGR
- **David Spielfogel** – Senior Advisor to the Mayor
- **Jack Johnson** – Chief Administrative Officer, Choose Chicago
- **Andrew Mooney** – Commissioner, Department of Planning and Development
- **Diego Klabjan** – Professor, Northwestern University

The Chicago Park District wishes to thank the pro-bono partners who made this study possible, and the colleagues and partners of its organization for their contribution to it.

- **Civic Consulting Alliance** – Liz Coon, Rose Fealey, Stuart Henige, Jim Pitroski, Karen Goldner, Christian Hines, Connie Kresge, Alison Lo
- **Global Economics Group** – Andra Boliker, Chad Coffman, Shefali Khatri, Candice Rosevear
- **Roland Berger Strategy Consultants** – Antonio Benecchi, Chris Hoyes, Sage Jung
- **Chicago Park District** – Mike Kelly, Gia Biagi, Samantha Chavis, Brendan Daley, Mary Eysenbach, John Gallagher, Cameron Harmon, Diane Hren, Steve Lux, Doreen O'Donnell, Jeffrey Shellhorn, Samantha Stivers, Ken Tassone, Jason Tinkey, Alonzo Williams, Dana Zilinski
- **Chicago Park District Partners:** Live Nation, SMG Management, Westrec Chicago Harbors

¹⁶ Contributors' positions listed are those they held during project timeframe
